LANGUAGE BACKGROUND

Shupamem is an understudied Grassfields Bantu language of the Western Province of central Cameroon spoken by approximately 420,000 speakers (Eberhard et al., 2021)

LANGUAGE BACKGROUND

Shupamem is a tonal language that exhibits four contrastive surface tones:

- kà 'onion' (L)
- ká 'fry.IMP (H)
- kå 'remove.IMP' (LH)
- **kâ** 'may' (HL)

The data presented here are original and have been collected from one native speaker of Shupamem, Abdoulaye Laziz Nchare, for the past two years in NYC.

REDUPLICATION IN SHUPAMEM

Reduplication is a very common morphological process cross-linguistically. Approximately 75% of world languages exhibit either partial reduplication or full reduplication (Rubino, 2013).

In Shupamem, both nouns and verbs undergo full reduplication. The former reduplicate to create plurals, and the latter to introduce semantic contrast.

NOUN REDUPLICATION

• Nouns:

là 'trap' – lǎ là 'traps'kám 'crab' – kâm kàm 'crabs'

	là →	lă là	kám →	kâm kàm
Tones:	L	LH L	Н	HL L
Segments:	la	la la	kam	kam kam

• Verbs:

fí 'froth.IMP' – fí f⁴í 'froth.IMP (as opposed to stirring)' lǎp 'heat.IMP' – lǎp l⁴áp 'heat.IMP (as opposed to freezing)'

	fí	\rightarrow	fí f [↓] í	lǎp	\rightarrow	lǎp l⁺áp
Tones:	Η		ΗН	LH		LH H
Segments:	fi		fi fi	lap		lap lap

2-WAY FST FOR FULL REDUPLICATION

Dolatian and Heinz (2020) addresses the challenge of modelling full reduplication with 2-way FST. 2-way FSTs are allowed to move back and forth on the input tape but not on the output tape.

2-way FST:

- reads the input tape from left to right and outputs the first copy of the input string
- once it reaches the end of the word (⋉), it rewinds and iterates the string from right to left outputting nothing and stops when it sees the beginning of the word symbol (⋊)
- reads the input tape again outputting second copy of a word

AN EXAMPLE OF 2-WAY FST

Figure 1: 2-way FST for total reduplication of $k\hat{a}$ 'fry.IMP $\rightarrow k\hat{a} k\hat{a}$ 'fry.IMP as opposed to boiling'

MT-FST

Autosegmental representations can be mimicked using finite-state machines, in particular, MT-FSTs (Wiebe, 1992; Dolatian and Rawski, 2020a; Rawski and Dolatian, 2020).

MT-FST:

- can operate on more than one level (tape)
- can take a single string as input and output multiple string on different tapes
- can do the reverse: take a multiple strings as the input and output a single string
- can operate on different tapes simultaneously or it can operate in an asynchronous fashion

SYNTHESIS OF 2-WAY AND MT-FST

In order to model full reduplication and to faithfully represent tonal processes separate from the segmental ones, we propose a synthesis of 2-way and MT-FST.

• 2,2 MT \rightarrow both input and output are represented on two tapes: Tonal and Segmental

- 2,2 MT \rightarrow both input and output are represented on two tapes: Tonal and Segmental
- 1-way FST → Tonal Tape: Opposite Tone Insertion (Markowska, 2020) inserts an opposite to the lexical tone (H → HL~)

- 2,2 MT \rightarrow both input and output are represented on two tapes: Tonal and Segmental
- 1-way FST → Tonal Tape: Opposite Tone Insertion (Markowska, 2020) inserts an opposite to the lexical tone (H → HL~)
- 2-way FST \rightarrow Segmental Tape: full reduplication (ndap \rightarrow ndap~ndap)
